

React testing library

Instruction:

1. Download react app from zip file provided here

https://drive.google.com/file/d/1UWU_npyeBWYNVpQ691fErYLJky9yCt5/view?usp=drive_link

2. Install node modules and see the functionality of how we can add a test and delete a test.

3. Create a folder **__tests__** in the **src** folder

4. You have to write test cases using react-testing-library. Make separate four files in **__tests__** folder.

5. The first test should test if the heading is correct, which is Todo's.

6. The second test should Test adding and displaying a single todo

This will test across all the components and check if adding a new todo item will work or throw an error.

7. Third test case : Test adding and displaying multiple todos. Means you have to test whether adding multiple todos will work properly or not.

8. Fourth test case : Test deleting a todo

Means you have to test how you can select a single todo and delete it from your application just like you'd do if it were manual testing.
